

Looking at paged media: 2021 edition

I've documented my research on using CSS Paged media for PDF printed output in different posts:

- [CSS paged media](#)
- [CSS paged media update](#)
- [Revisiting paged media stylesheets for the web](#)

These stylesheets were designed to work with [PrinceXML](#) and [AntennaHouse](#). They are good tools but licensing them for unrestricted use may be pricier than what an open source project can afford. I wrote about them in [Revisiting paged media stylesheets for the web](#) and about using PrinceXML to generate PDF from Markdown in [Generating HTML and PDF from Markdown](#)

[Vivio Style](#) seems like an interesting open source, GPL licensed, alternative to commercial libraries. As I suggest for every piece of GPL software, read the license and see if it matches the needs of your project.
