

# Scratch pad

I also seek to answer the following questions:

1. Is Brave 3x faster than Chrome as it was reported with Brave 1.0?
  1. Has anyone repeated the experiment in more recent versions of the browsers?
  2. Are there other empirical reports of post 1.0 performance testing?
  3. Has anyone updated the tests they run with Brave 1.0?
2. Is Brave faster with Extensions enabled?
  1. Will extensions downloaded from the Chrome Web Store work in Brave considering their stance against manifest V3?
  2. Is Brave still faster when you add extensions like Grammarly that inject scripts into the page?
3. Is using a clean profile the best way to test for performance? Isn't it the case that a working browser will provide different results?
4. Is Brave faster when a service worker intercept requests?
  1. How about on second and subsequent visits?
5. Network impact
  1. Does performance change if you use TOR with Brave?
  2. Do VPNs affect browser's performance?
6. Does building the browsers from source have an impact on performance?
7. Does automation change the results of performance tests?
  1. Is there a statistically significant difference between manual and automated testing?
  2. Do different tools have different impact on the analysis?
8. Browsertime recommends a global install. Does this affect performance as opposed to installing it locally?
9. Is using Playwright a better option than Selenium Driver?
