

Putting theory to practice

In his CSS article [The JavaScript Learning Landscape in 2018](#) Jason Rodriguez asks

Raise your hand if this sounds like you:

You've been in the tech industry for a number of years, you know HTML and CSS inside-and-out, and you make a good living. But, you have a little voice in the back of your head that keeps whispering, "It's time for something new, for the next step in your career. You need to learn programming."

- Set up a schedule
- Code locally and build specific projects
 - Static Labs site
- Continue writing blog posts (2 x week)
- Keep up with news via the blogs, newsletters, and podcasts I like
- Dive into JavaScript 30 and ES6 for Everyone
 - Pick one or two additional courses, particularly one on React
- Build some (hopefully) cool stuff in the process
