

Generic block components: updating the blog-posts component

In the first post of this series we created a bare-bones blog-posts components to display the default result of WordPress posts REST API query.

But even in that post we made a few notes for future enhancements:

- How to control the number of posts that the component shows?
- How to show pages beyond the first page (what WordPress returns by default when querying the API)?

Controlling the number of posts shown

(how to control the `per_page` value)

Controlling what page to show
