

# Markdown Scripts

It's possible to write scripts using markdown. Only code blocks will be executed by zx.

You can run this markdown file:

```
zx docs/markdown.md
```

```
await `$whoami`  
await `$echo ${__dirname}`
```

The `__filename` will be pointed to [markdown.md](#):

```
console.log(chalk.yellowBright(__filename))
```

We can use imports here as well:

```
await import('chalk')
```

A bash code (with bash or sh language tags) also will be executed:

```
VAR=$(d$(date)ho "$VAR" | wc -c
```

Other code blocks are ignored:

```
body .hero {  
  margin: 42px;  
}
```
