JSON block registration

Starting in WordPress 5.8, there is a JSON metadata file we can use to register blocks. The `block.json` file is the block-level equivalent to `theme.json` and is now the preferred way to register blocks.

The following example contains a `block.json` definition for a fictional `my-plugin/notice` block.

```
{
    "apiVersion": 2,
    "name": "my-plugin/notice",
    "my-plugin/notice""title"ategory": "text""": ""category": [ "core/group
  "core/group"tar",
    "description": "Shows warni": ""icon": "star",
    "description"keywords": [ "alert", "message" ],
    "version": ": [ ""version""keywords": "my-plugin",
    "attributes"my-plugin""version": "1.0.3",
    "textdomain": "my-plugin",
    "attributes""html",
    "html""message"or": ".message"
": ""type": "string",
            "source": "html",
            "selector"ssage"
    },
    "usesContext": [ "groupId" ],
    ": [ ": {
        "my-plugin/message"    },
    "styles": [
"styles""usesContext"fault", "label": "Def", ""supports": {
        "align"    { "name": "othe": ""styles" "Other" }
    "Other""name": "default", "label": "Default", "isDefault""message": "Th
        "attributes": {
            "message"    "editorStyle": "file:./build/index.css""": ""edito
    "script": "file:./build/script.js",
    "editorStyle": "file:./build/index.css",
    "style": "file:./build/style.css"
}
```

See [Metadata](#) in the Block Editor Handbook for more information about the file and the fields in it.
